HALOGEN FREE DECLARATION

Halogens are defined as chemical elements that belong to group 17 of the periodic table, specifically the elements fluorine, chlorine, bromine, iodine and astatine.

None of the products manufactured by Holroyd Components Limited contain the elements fluorine, bromine, iodine or astatine

The definition of “Halogen Free” used by the International Electrochemical Commission (IEC) is defined in standard IEC 61249-2-21.

This states that a product can be called “Halogen Free” if it contains less than:

- 900 ppm chlorine
- 900 ppm bromine
- 1500 ppm total halogens

The results shown above enable us to support the statement that products manufactured by Holroyd Components Limited are Halogen Free as our products meet the limits of IEC 61249-2-21.
